Daraz.com.np — Product Search Feature

Document ID: REQ-DZ-SEARCH-01 | Version: 1.0 | Prepared By: QA Instructor | Date:
[Insert Date]

Your Assignment

Using ONLY the requirements listed in this document, produce three deliverables:

1. **Test Scenarios** — a high-level scenario for each requirement (link each Scenario ID to a Requirement ID).
2. **Test Cases** — detailed, step-by-step test cases covering every scenario (include Preconditions, Steps, Test Data, and Expected Result).
3. **Requirement Traceability Matrix (RTM)** — a matrix mapping every Requirement ID to its Scenario ID(s) and Test Case ID(s), proving full coverage.

You may explore the live site at daraz.com.np to understand the actual UI before writing your test cases, but every requirement you test must trace back to a line item below.

1. Introduction

This document describes the functional and non-functional requirements for the **Product Search feature** on the Daraz.com.np e-commerce website. The search feature allows a visitor to find products by typing a keyword, then refine and browse the results using filters and sorting options. This document is provided as the basis for a QA practical assignment — students are expected to design test scenarios, test cases, and an RTM directly from the requirements below, without being given the answers in advance.

2. Feature Overview

The search feature is accessible from a search bar in the site header, present on every page. A user types a keyword (e.g. a product name, brand, or category), submits the search, and is shown a results page listing matching products. From the results page, the user can further refine results using filters (price, brand, rating, location, shipping) and change the order of results using sort options.

3. Functional Requirements

Req. ID	Requirement Description
REQ-01	The system shall display a search bar in the header on every page of the website.
REQ-02	The system shall allow the user to enter a keyword and initiate a search by pressing Enter or clicking the search icon.
REQ-03	The system shall display auto-suggestions (matching products/keywords) as the user types in the search bar.
REQ-04	The system shall return a results page listing all products whose title, brand, or category matches the searched keyword.
REQ-05	The system shall perform a case-insensitive search (e.g. "laptop", "Laptop", and "LAPTOP" return the same results).
REQ-06	The system shall display a clear "No results found" message, along with suggested alternatives, when a search returns zero matching products.
REQ-07	The system shall allow the user to filter search results by Price Range (minimum and maximum).
REQ-08	The system shall allow the user to filter search results by Brand.
REQ-09	The system shall allow the user to filter search results by Customer Rating (e.g. 4 stars & above).
REQ-10	The system shall allow the user to filter search results by Location and/or Free Shipping availability.
REQ-11	The system shall allow the user to apply multiple filters simultaneously, and the results shall reflect the combination of all active filters.
REQ-12	The system shall allow the user to clear individual filters or reset all filters at once.
REQ-13	The system shall allow the user to sort search results by: Popularity, Price (Low to High), Price (High to Low), Newest, and Top Rating.
REQ-14	Each product in the search results shall display: product image, title, current price, discount percentage (if any), and average customer rating.
REQ-15	The system shall support pagination (or "Load More") so the user can browse beyond the first page of search results.
REQ-16	Clicking on a product in the search results shall navigate the user to that product's detail page.
REQ-17	The system shall retain the entered search keyword in the search bar after the results page loads.

4. Non-Functional Requirements

Req. ID	Requirement Description
REQ-18	Search results shall load within 3 seconds under normal network conditions.
REQ-19	The search bar and results page shall be fully usable on both desktop browsers and mobile screen sizes (responsive layout).
REQ-20	The search function shall handle special characters and emojis gracefully without causing an error or a broken page.
REQ-21	The search function shall handle leading/trailing whitespace in the search query without affecting results.

5. Assumptions & Constraints

- Testing is performed on the public website; no login is required to search or browse products.
- Testing should be treated as read-only / observational — do not complete any real purchase.
- Product inventory, pricing, and available filters may change over time since this is a live production site.
- Where the live site's exact behavior differs from a requirement below, note the discrepancy in your test case rather than silently changing the requirement.

6. Format for Your Deliverables

Use the following column structure so your work is easy to review:

Deliverable	Required Columns
Test Scenarios	Scenario ID, Requirement ID, Test Scenario Description, Priority
Test Cases	Test Case ID, Scenario ID, Title, Preconditions, Test Steps, Test Data, Expected Result, Priority, Status
RTM	Requirement ID, Requirement Description, Scenario ID, Test Case ID(s), Test Execution Status
